

Precision Measuring Systems Kit

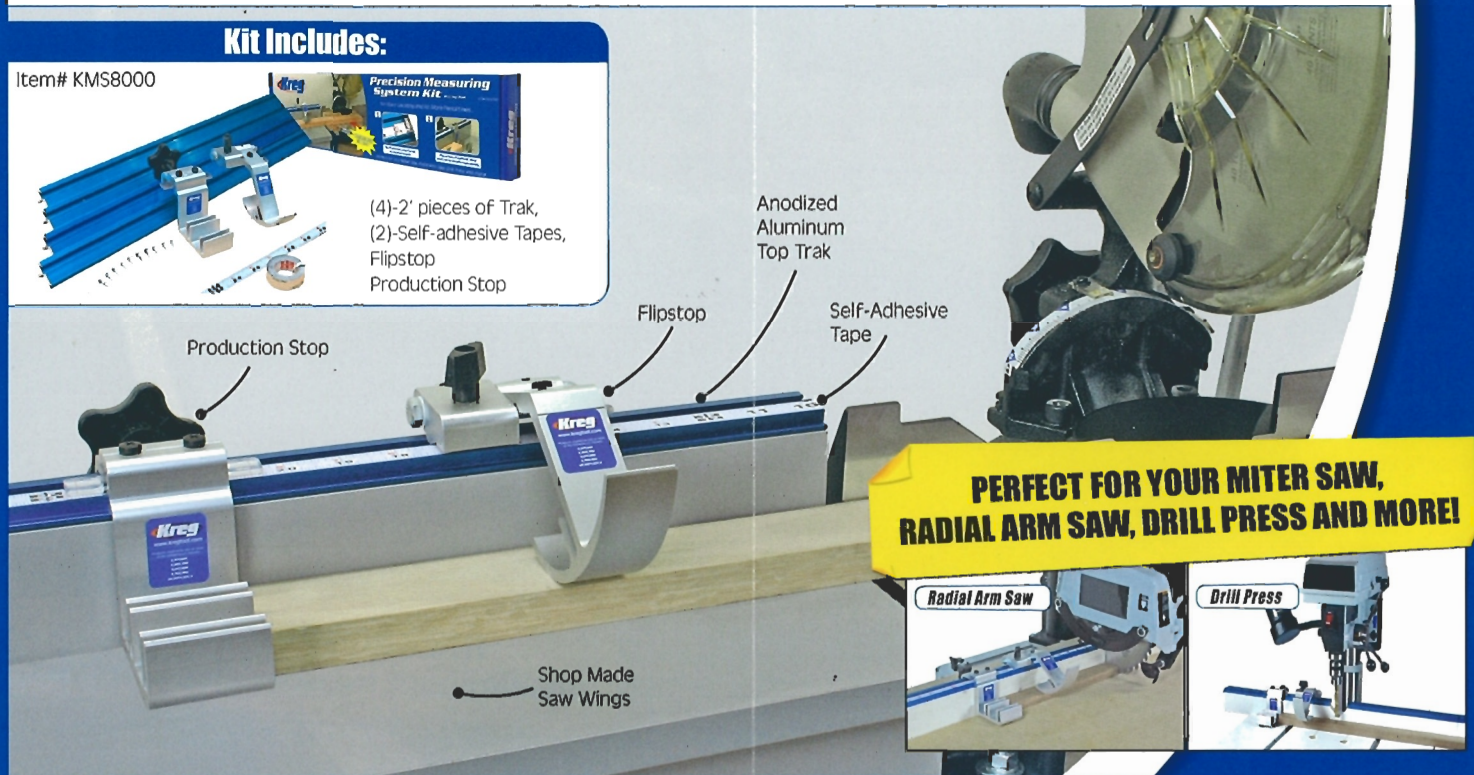

Cut precisely, time after time! The inaccuracy of pencil marks on a board can be compounded by the need to follow that mark precisely with the saw blade. Our Precision Measuring Systems Kit is designed to take the guesswork out of cutting wood to length. This kit contains 8' (4 - 2' sections) of anodized aluminum trak that can be mounted to a shop made support wing built to the height of your miter saw. A 1/2" self-adhesive tape is then applied to the top of the fence. Finally, slide the Flipstop and Production Stop onto the top of the trak and you have a precision cutting station that eliminates the need for a tape measure and pencil. Simply place the precision lens cursor over the board length desired, press the board against the stop, and cut away! Precise, repeatable cuts could not be any easier.

Kit Includes:

Item# KMS8000

(4)-2' pieces of Trak,
(2)-Self-adhesive Tapes,
Flipstop
Production Stop

**PERFECT FOR YOUR MITER SAW,
RADIAL ARM SAW, DRILL PRESS AND MORE!**

Radial Arm Saw

Drill Press

Stop Measuring and Start Cutting...

Simply set precision stop cursor to board length needed, place board against stop and cut *EXACTLY* to length. No more measuring errors and no more guessing if you should take the line, leave the line or split the line!

1. Set Precision Lens
Cursor to desired length

2. Place board against stop
and cut to length repeatedly
