

PRO-GRIP™ Story Stick*

Installation and Set-up

PRO-GRIP™ straight edge clamps are perfect for cutting stock to large for a table saw. In order to set the straight edge clamp up to cut longer stock, you must measure the distance from the cut (blade) to the clamp edge to find the off-set each time you cut. With the PRO-GRIP Story Sticks you won't have to do this.

The story sticks will align your clamp and saw perfectly every time.

Step 1

With the pre-drilled countersunk holes facing away from the PRO-GRIP™ clamp jaw, attach your story stick directly to the jaw of the locking clamp head with the two wood screws provided in the pack.

Step 2

Clamp the PRO-GRIP™ clamp with the story stick attached to a scrap piece of plywood securely. Cutting about a 1/4" of plywood material off with your circular saw, follow all the way through the story stick - cutting the end of the story stick off. Your Story Stick is now set-up for your particular circular saw.

Step 3

Place a mark on your project stock where it needs to be cut. Place the PRO-GRIP™ clamp with the story stick attached on to the stock. Slide the clamp over until the cut-off end of the story stick lines up with your mark. The end of your story stick shows you exactly where your saw blade will cut through your stock.

Step 4

With the PRO-GRIP™ clamp secured in place make the cut on your plywood. The blade should pass right through your mark and right passed the story stick.

Perfect Alignment

Now that you know how to set-up your story sticks, set one up for your router or even a laminate trimmer. The PRO-GRIP™ story sticks are great off-set markers for your straight edge clamps that work with different power tools that need to be aligned.

*Note: The PRO-GRIP™ Story Sticks are designed for use with PRO-GRIP™ Straight Edge Clamps only.
